

SERVITOR FOUNDRY · INSTANCE: GPT_05

The Foundry, drawn as it actually runs

DRAWING FND-01

REV 2026-07-20

2 hosts · 4 doors

3 sockets · 4 light levels

A factory that builds software. You **speak into a door**, a crew wakes up inside, and the walls are wired to helpers outside. This is the same building Kayden sketched — labelled, and honest about which lights are actually on.

FND-01 · not to scale

legend follows ↓

Every part, named

 Door A · Codex

One of two doors on every building. Speak into it and the *Codex* crew wakes.

SERVITOR-1A / 2A

 Door B · Claude

The other door. Same building, different crew — *Claude*. This chat came in here.

SERVITOR-1B / 2B

 Door C · open slot

The dashed door. When Gemini “steps up,” it becomes a third door on every wall — the slot is already drawn.

RESERVED

 The two buildings

Two whole Foundries: your **Mac Mini** and your **PC**. Same design, running in two places.

HOST 1 · HOST 2

 The Git cord

The wire *between* buildings. Not a live phone line — a shared notebook. One crew writes, the other reads later.

 live · async

 Recall socket → OpenBrain

A wire out to a fast filing clerk. “The Wiki remembers; OpenBrain recalls.” Your blue wire was this.

 live

 Interface socket → Mirror

The cord up to the dashboard. It *shows* the floor plan today; showing the live lights is still being built.

 half-built (S-013)

 Messaging socket → Discord

The intercom that taps *you* on the shoulder. Outbound only — it announces, you don't command through it yet.

 built, not authorized (403)

"Is the light on?" has four settings

L0 · SLEEPING Lights off Cheap, model-free checks: did any file or commit change? If no — exit. Nothing wakes. no model · \$0	L1 · DISPATCHER Captain only One light. Reads the state, decides if real work exists, hands it out. Coordinates — doesn't build. Sonnet / Luna	L2 · WORKERS The floor lights up Engineer and Auditor crews execute one slice and check it. Haiku / Codex · Opus for hard work
L3 · EXECUTIVE Floodlights Novel architecture, big conflicts. Escalation only — a deliberate exception, never the default. Fable / Sol		

Your token leak, in one line. The "chronicle" — Codex quietly screenshotting to study your desktop — was a light stuck **ON** every scheduled wake, burning tokens to discover nothing had changed. **L0 is the off-switch that didn't exist yet.** It's designed, tested first, and waiting on your go.

What am I looking at?

Imagine a **factory that builds software instead of cars**. You don't push buttons — you walk up to a door and **say what you want out loud**. A foreman inside hears you, flips on the lights, and a crew comes running: some read the instructions, some build, some inspect the work.

There are **two of these factories** — one on Kayden's Mac, one on the PC — and each has **two doors**: one crew is Codex, the other is Claude. The factories don't shout across the street to each other; they **leave notes in a shared notebook** (that's the cord between them) and read them when they get to it.

Bolted to the outside walls are **helpers on wires**: a **memory clerk** that fetches things fast, an **intercom** that can buzz Kayden's phone when something important happens, and a **big mirror overhead** that's meant to show everything going on at a glance.

The honest part: **the mirror and the intercom aren't finished**. That's why, when one crew quietly turned on a camera, Kayden only noticed by watching closely. Finishing them is exactly what's on the workbench now — so the building can tell you what it's doing, instead of you having to catch it.

- **Live:** the doors, the crews, the Git notebook, the memory clerk
- **Half-built:** the mirror's live view
- **Waiting:** the intercom, the L0 off-switch

SERVITOR FOUNDRY · FND-01 · a map, not the machine

live status lives in the Mirror, not this drawing
